Contents

1	Option Pricing	15
1.1	Orientation	15
1.2	A Brief Introduction to Options	15
1.2.1	The European Vanilla Call Option	15
1.2.2	Option Pricing: the Black-Scholes Model	16
1.2.3	Other European Options	19
1.3	Constant Coefficients. The Black-Scholes Formula	20
1.4	Monte-Carlo Methods	23
1.4.1	Numerical Random Variables	23
1.4.2	Random Variables Using the Gnu Scientific Library	27
1.4.3	Variance Reduction	27
1.5	Other Options	30
1.5.1	American Options	30
1.5.2	Asian Options	31
1.6	Complement: Binomial Trees	32
1.6.1	The Tree for S	33
1.6.2	The Tree for C	34
2	Black-Scholes PDE	39
2.1	Orientation	39
2.2	The Partial Differential Equation	40
2.2.1	Infinitesimal Generator of the Diffusion Process	40
2.2.2	Vanilla Options: Behavior for Extremal Values of S	42
2.2.3	The Black-Scholes Equation in Logarithmic Prices	42
2.3	Mathematical Analysis	43
2.3.1	Some Function Spaces	44
2.3.2	The Weak Formulation of the Black-Scholes Equation	47
2.3.3	Regularity of the Weak Solutions	49
2.3.4	The Maximum Principle	52
2.3.5	Consequences of the Maximum Principle	53
2.3.6	Dupire's Equation	57
2.4	Barrier Options	59
2.5	Lévy Driven Assets	60
2.6	Options on a Basket of Assets	62

2.7	Stochastic Volatility	65
3	Finite Differences	73
3.1	Finite Differences in Logarithmic Prices	73
3.1.1	Basic Estimates from Taylor Expansions	73
3.1.2	Euler Explicit Scheme	74
3.1.3	The Euler Implicit Scheme	83
3.1.4	The Crank-Nicolson Scheme	86
3.2	Upwinding	88
3.3	Finite Differences in the Primitive Variables	92
3.3.1	Euler Implicit Scheme	93
3.4	Numerical Results	97
3.5	Which Variable is Better?	100
3.6	Options on a Basket of two Assets	100
3.7	An Asian Put with Fixed Strike	102
3.7.1	An Upwind Scheme with respect to A	102
3.7.2	A program in C++	104
4	The Finite Element Method	113
4.1	Orientation	113
4.2	A Generic Problem	114
4.2.1	Variational Formulation	114
4.2.2	The Time Semi-Discrete Problem	117
4.2.3	The Full Discretization: Lagrange Finite Elements	117
4.2.4	The Discrete Problem in Matrix Form	119
4.2.5	The Nodal Basis	119
4.2.6	Stabilization by Least Squares	121
4.3	The Black-Scholes Equation with Local Volatility	122
4.4	A Black-Scholes Equation Solver in C++	125
4.5	A Transparent Boundary Condition	128
4.6	Lévy Driven Assets	135
4.6.1	A Scheme with an Explicit Discretization of the Non Local Term	135
4.6.2	A Semi-Implicit Scheme and a Program for Options on CGMY Driven Assets	135
4.7	Programs for the Two Dimensional Case	147
4.7.1	Options on a Basket of Assets	147
4.7.2	A Stochastic Volatility Model	151
4.7.3	Matrix Storage: the Compressed Sparse Row Format	159
4.8	Programming in Dimension $d > 2$	163
4.9	Introduction to Sparse Approximations for High Dimensions	163
4.9.1	Wavelets in \mathbb{R}	164
4.9.2	Sparse tensor Product Spaces	165
4.10	Appendix: The full program for 2D Black-Scholes	166

5	Adaptive Mesh Refinement	173
5.1	The Black-Scholes Equation and some Discretizations	174
5.1.1	The Black-Scholes Equation and its Variational Formulation	174
5.1.2	The Time Semi-Discrete Problem	176
5.1.3	The Fully Discrete Problem	177
5.2	Error Indicators for the Black-Scholes Equation	178
5.2.1	An Upper Bound for the Error	178
5.2.2	An Upper Bound for the Error Indicators	180
5.3	Conclusion	181
5.4	A Taste of the Software	181
5.5	Results	188
5.5.1	Test with a Uniform Volatility	188
5.5.2	Result with a Non Uniform Local Volatility	194
5.6	Mesh Adaption for a Put on a Basket of Two Assets	196
5.7	Appendix: Proofs	198
6	American Options	207
6.1	Introduction	207
6.2	The Variational Inequality	208
6.3	The Exercise Boundary	211
6.4	Discrete Approximations to the Variational Inequality	214
6.4.1	Existence and Uniqueness for (6.28)	216
6.4.2	Stability	217
6.4.3	Convergence	217
6.4.4	The Discrete Exercise Boundary	220
6.5	Solution Procedures	221
6.5.1	The Projected SOR Algorithm	221
6.5.2	The Brennan and Schwartz Algorithm	223
6.5.3	A Front-Tracking Algorithm	224
6.6	A Program in C++ for the American Put	224
6.7	Results	228
6.7.1	Uniform Coefficients	228
6.7.2	Local Volatility	233
6.8	More Complex American Options	233
7	Sensitivities and Calibration	239
7.1	Introduction	239
7.2	Automatic Differentiation of Computer Programs	239
7.2.1	The Direct Mode	240
7.3	Computation of Greeks	243
7.3.1	Greeks for American Options	244
7.4	Application to Calibration	246
7.4.1	Formulation with Dupire's Equation	247
7.4.2	Numerical Tests	248
7.5	Finite Dimensional Differentiable Optimization	248
7.5.1	Conjugate Gradient Method	250

7.5.2	One Line Search	250
7.5.3	An implementation in C++	251
7.5.4	Calibration on a Basis of Solutions	252
7.5.5	Basis with Constant Volatilities for Dupire's equation	253
7.5.6	Numerical Results	254
7.6	Appendix	254
8	Calibration with European Options	261
8.1	The Least Square Problem	262
8.2	Which Tychonoff Functional?	263
8.3	Existence of a Minimizer	265
8.4	The Gradient of J	266
8.5	The Discrete Problem	268
8.6	A Flavour of the Program	270
8.7	Results	272
8.8	A Stochastic Control Approach	274
8.8.1	A Minimax Dual Program	276
8.8.2	Formal Derivation of (8.30)	278
8.8.3	Verification	279
8.8.4	Algorithm	280
9	Calibration with American Options	283
9.1	The Calibration Problem	283
9.2	A Penalized Problem	285
9.3	Necessary Optimality Conditions	289
9.4	Differentiability	295
9.5	Algorithm	296
9.6	Results	299
9.6.1	Testing the Method with a Volatility Chosen Beforehand	299
9.6.2	Results with American Puts on the Footsie Index	303

Index

- A posteriori error estimates, 112
- A posteriori error indicators, 172
- A priori error estimates, 112
- Adaptive mesh refinement, 167
- Adaptive method
 - for American options, 222
 - for basket options, 189
 - for European options, 182
- Adjoint state, 258, 280
- Algorithm
 - Brennan and Schwartz, 217
 - front tracking, 218
 - Projected SOR, 215
 - SOR, 215
- Algorithms for the American puts, 215
- American options, 201
 - calibration with, 273
- Antithetic variate, 28
- Armijo rule, 242
- Asian option, 100
- Automatic differentiation, 234
- Barrier options, 57
- Barycentric coordinates, 117
- Basket options, 60, 98, 140, 189
- Binomial option pricing, 32
- Binomial tree, 32
- Black-Scholes
 - formula, 21
- Brownian motion, 17
- Calibration, 18, 244
 - a stochastic control approach, 265
 - of jump diffusion models, 253
 - with American options, 273
 - with European options, 253
- Central limit theorem, 26
- CFL condition, 78
- CMGY process, 60, 134
- Compressed Row storage, 154
- Consistency
 - of the Crank-Nicolson Scheme, 85
 - of the Euler explicit scheme, 76
 - of the Euler Implicit Scheme, 82
 - definition, 74
- Control variate, 27
- Convergence
 - of the Euler explicit scheme, 79
 - of the Euler Implicit Scheme, 84
 - of the Euler Implicit Scheme in the primitive variables, 95
 - of the finite element method, 112
 - definition, 75
 - of the F.E.M for the American put, 211
- Convexity of the European put's price, 53
- Diagonal dominant matrix, 86, 215
- Dividends, 41
 - Discretely paid dividends, 41
- Drift, 17
- Dupire's equation, 55, 244
 - for calibration, 254
 - sensitivity, 236
- Entropy, 268
- Euler explicit scheme, 72
