

minerals has shed light on the role of water and ice in modifying the compositions of surface materials. Ice appears to have a global influence on the production of secondary phases, whereas the effects of water are discovered in unique and locally diverse geological settings. Future orbiters and landers will focus on these local settings in the search for evidence of habitable Martian environments, and perhaps even signs of extant or present life.

ACKNOWLEDGMENTS

The authors wish to thank John Mustard and an anonymous reviewer for helpful comments that improved the quality of this manuscript. We would also like to sincerely thank all of those who built and continue to operate the MGS, Odyssey, and MER spacecraft. ■
