

## Magnetoassociation via Feshbach resonances: formation of ultracold ground-state molecules in a single quantum –highly-excited- energy level

Atoms with electronic AND nuclear magnetic moments (alkalis, lanthanides,...)

First pointed out by Stwalley (PRL **37**, 1628, 1976) and Tiesinga et al (PRA **47**, 4147, 1993)

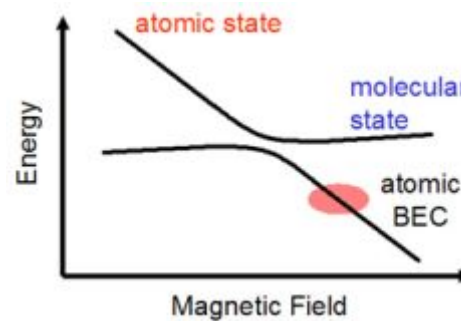

The magnetic moment of a molecular complex and of an atom pair are different, so that their energy vary differently with magnetic field

= Change of the dissociation energy of a high-lying molecular bound state
