

Fig. 12.6. Two-month composite of NOAA AVHRR data for January—February for the years 1986 and 1987. At this time, the composite of mean radiation temperatures indicate that the Po waters are shown to flow in a narrow stream southward along the Italian coast. (From Marullo and La Violette, 1991.)

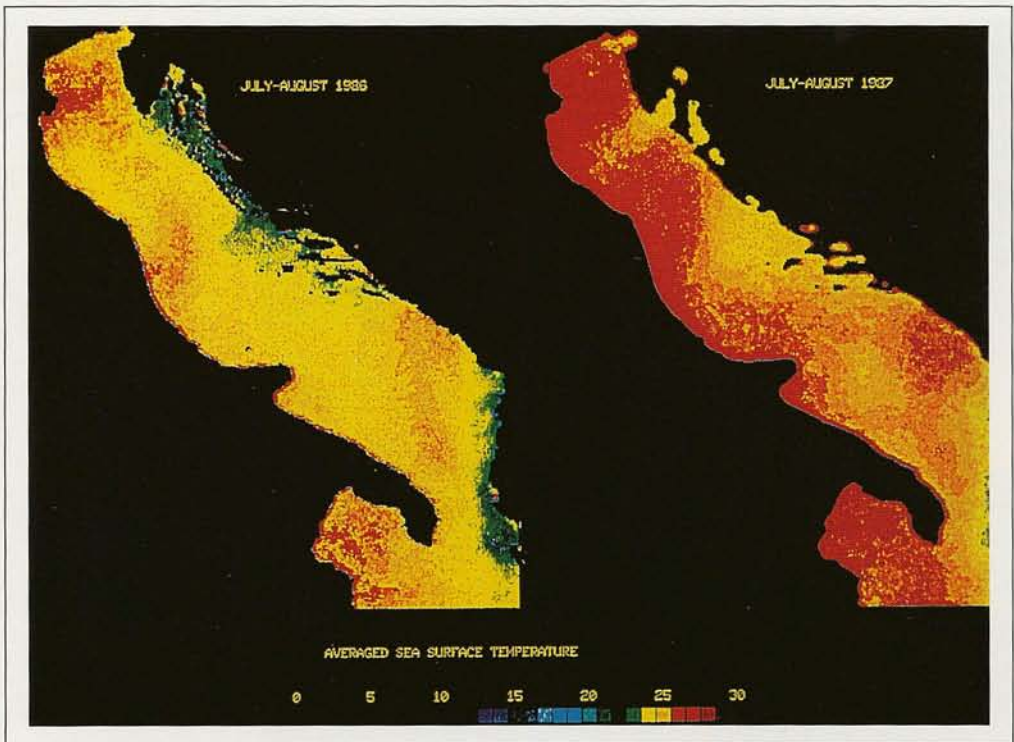

Fig. 12.7. Two-month composite of NOAA AVHRR data for July—August for the years 1986 and 1987. The composite of mean radiation temperatures indicate that the Po River outflow is diverted into the northern basin and retained in that area during the summer. (From Marullo and La Violette, 1991.)
